

Polypropylene (PP) Food Contact Material: Declaration of Non-Allergen Compliance

We hereby declare that the polypropylene (PP) plastic components produced by Modutech, intended for food contact applications, are manufactured under hygienic conditions to prevent contamination, including potential contamination with food allergens.

The raw material (PP) used in our production is free from any intentionally added food allergens, including but not limited to milk proteins, egg proteins, soy, gluten (wheat), peanuts, tree nuts, fish, and shellfish.

Measures are implemented in the production environment to prevent potential cross-contamination with allergenic substances.

Importantly, our production processes do not involve handling of food or food ingredients, thereby eliminating any potential risk of allergenic cross-contamination. The materials used comply with hygiene standards that ensure the absence of allergenic substances.

Furthermore, our PP components are compliant with all relevant European Union regulations for food contact materials, including the general principles of Regulation (EC) No. 1935/2004 and the detailed requirements of Commission Regulation (EU) No. 10/2011, which establish authorized substances, specific migration limits (SML), and overall migration limits (OML) for plastic materials. In addition, our materials meet the necessary criteria outlined in the U.S. Code of Federal Regulations (21 CFR Part 177.1520) for olefin polymers used in food contact applications, ensuring that no hazardous levels of migration occur under intended conditions of use.

This declaration is based on current production processes and material specifications. Modifications to materials or processes may require re-evaluation.

Based on our controls and assessments, no risk of allergen contamination is present in the modular belt food contact plastic components produced by Modutech.
